TruMedia Networks Project

Overview

- This project is intended to explore front end development, data visualization, and analytics.

- The project is open ended, but we're not looking to have you put in a ton of hours on it. It's intended to be a roughly half day project and can be completed at home anytime before we meet for an in person interview.

Description

- The goal of the project is to create a display for an MLB batter's performance over time.

- You'll be provided data for 3 MLB batters in JSON format with one row per game that each batter played. In each row you'll have their AB, H, RBI, and HR totals for the game.

- We're interested in seeing that data, plus AVG (which is calculated as H / AB) displayed over time.

- You do not need to create a comparison UI, it's sufficient for this project to display the data for each batter one at a time on separate pages.

Output

- We're looking to receive a folder of static web files that we can run in a browser.

- We will review the source code as well as discuss the decisions you made on how to present the data when we meet in person.
